SEO GEO AEO Audit Report

FULL AUDIT

SEO	GEO	AEO
8	6	7
Strong	On Track	On Track

Audit date 18 September 2026
Codex Skill and Plugin by Alex Labat

Executive Summary

SinShield has a strong technical and editorial foundation. All ten public pages are available as meaningful prerendered HTML, canonical metadata is consistent, structured data is unusually complete for a young product site, and the major articles cite research and official sources responsibly. The most urgent problem is narrow but real: the live llms.txt URL still serves homepage HTML, so AI-oriented discovery tools cannot read the prepared Markdown file. The largest strategic opportunity is trust: named authors, an editorial standards page, and clearer ownership would materially strengthen authority for content touching sexual health, behavior change, and law.

Dimension	Score	Status	Key takeaway
SEO	8/10	Strong	Crawlable, well-marked-up pages; improve hubs, internal links, and snippet lengths.
GEO	6/10	On Track	Strong facts and citations; weak author identity and invalid live llms.txt reduce trust and discoverability.
AEO	7/10	On Track	Good direct answers, FAQ, lists, and tables; question-led structure is inconsistent.
Combined	21/30		A strong base with a focused trust and content-depth roadmap.

Top three priorities

- Deploy the prepared llms.txt so the live endpoint returns valid Markdown as text/plain instead of homepage HTML.
- Publish About and Editorial Standards content with named authors or reviewers, source policy, corrections process, and ownership details.
- Expand the product and blog hub pages, then build contextual internal links between articles and conversion pages.

Biggest strength

The strongest advantage is the combination of crawlable prerendered HTML, accurate structured data, and evidence-aware long-form articles. That gives search engines and answer systems substantially more reliable material than a typical JavaScript-only product site.

Audit Scope and Method

The audit reviewed the live public site on 18 September 2026. It fetched the homepage, both product routes, the blog index, every published article in the XML sitemap, robots.txt, llms.txt, and sitemap.xml. Findings are based on returned HTML, HTTP headers, visible content, internal and external links, metadata, and JSON-LD. The audit does not estimate backlinks, search rankings, traffic, or field Core Web Vitals; those require Search Console, analytics, and PageSpeed Insights data.

Pages audited

URL	Page type	Key observation
https://sinshield.app/	Homepage	875 words; unique metadata; Organization, WebSite, and FAQPage schema; H1 wording needs refinement.
https://sinshield.app/products	Product hub	31 words; valid HowTo and BreadcrumbList schema; very thin content and vague H1.
https://sinshield.app/products/android	Product detail	175 words; strong SoftwareApplication schema and concrete product facts; content remains thin.
https://sinshield.app/blog	Blog index	92 words; all six articles linked; H1 is the featured article title rather than the blog identity; no Blog or CollectionPage schema.
https://sinshield.app/blog/porn-on-x	Article	2,386 words; primary-source links, direct answers, Article and BreadcrumbList schema.
https://sinshield.app/blog/benefits-of-quitting-porn	Article	1,871 words; evidence-aware framing and source citations; title is long.
https://sinshield.app/blog/countries-where-porn-is-illegal	Article	2,275 words; strong legal caveats and official sources; title and description are long.
https://sinshield.app/blog/does-porn-lower-your-iq	Article	2,132 words; clear answer, nuanced research synthesis, and primary-source links.
https://sinshield.app/blog/best-accountability-apps-to-quit-porn	Article	3,554 words; detailed comparison and transparent first-party disclosure; title and description are long.
https://sinshield.app/blog/how-to-break-the-scroll-trigger-loop	Article	394 words; clear practical steps but no external sources and limited topical depth.

SEO Analysis

Score 8 of 10 - Strong

Technical On Page

Signal	Finding	Status
HTTPS and availability	All ten canonical pages returned HTTP 200 over HTTPS during the 18 September 2026 crawl.	Good
Server-rendered content	Meaningful HTML, headings, text, links, and schema are present before client-side JavaScript runs.	Good
robots.txt	Live file returns text/plain, allows all crawlers, and references the XML sitemap.	Good
llms.txt	The live /llms.txt endpoint returns the homepage HTML as text/html. The valid Markdown file exists locally but is not deployed.	Missing
XML sitemap	The sitemap lists all ten canonical public pages. It does not include lastmod dates.	Needs Attention
Canonical tags	Every audited page has one self-referencing canonical URL.	Good
Viewport and indexability	Every page has a mobile viewport and no accidental noindex directive.	Good
Response security headers	The live HTML response did not expose HSTS or Content-Security-Policy headers. This is a trust and hardening opportunity, not a direct ranking factor.	Needs Attention

Metadata and Page Structure

Signal	Finding	Status
Title tags	All titles are unique and topical. Six article titles exceed about 60 characters, increasing truncation risk.	Needs Attention
Meta descriptions	All pages have unique descriptions. Homepage, products, countries, and accountability exceed about 160 characters; blog and scroll-loop are comparatively short.	Needs Attention

Signal	Finding	Status
H1 coverage	Every page has exactly one H1. The blog H1 describes the featured article rather than the blog, and product H1s are less keyword-specific than their titles.	Needs Attention
Heading hierarchy	Long articles use logical H2/H3 structure. The product and blog hub pages have shallow heading structures because content is sparse.	Good
Image alternatives	All seven prerendered content images include alt attributes; no missing alt attributes were detected.	Good
Internal links	Articles expose only two or three unique internal links in prerendered HTML, leaving product discovery and topic-cluster relationships underdeveloped.	Needs Attention
Social metadata	Open Graph title, description, image, and Twitter card metadata are present on every audited page.	Good

Content Quality

Signal	Finding	Status
Long-form coverage	Five research-oriented articles contain 1,871 to 3,554 words and address their topics in substantial depth.	Good
Commercial page depth	Products has 31 words, Android has 175 words, and the blog index has 92 words. These pages do not fully answer comparison, compatibility, setup, or trust questions.	Needs Attention
Evidence and sourcing	Research and legal articles link to studies, official policies, and legislation. The scroll-trigger article has no external sources.	Good
Freshness signals	Article publication dates are visible and included in Article schema. dateModified currently equals datePublished on every article.	Good
Readability	Articles use concise paragraphs, lists, tables, note sections, and descriptive subheadings.	Good

Structured Data

Signal	Finding	Status
Schema validity	All detected JSON-LD blocks parsed successfully.	Good

Signal	Finding	Status
Organization and website	Homepage declares Organization, WebSite, and FAQPage entities with support contact information.	Good
Product schema	Android page uses SoftwareApplication with Android, free Offer, download URL, publisher, and image.	Good
Article schema	Every article includes Article and BreadcrumbList schema with headline, image, dates, publisher, and SinShield Editorial as author.	Good
Blog index schema	The blog index has no Blog, CollectionPage, or ItemList schema.	Missing
Entity links	Organization schema lacks sameAs links to verified brand profiles or app-store identity.	Needs Attention

GEO Analysis

Score 6 of 10 - On Track

Experience Expertise Authority and Trust

Signal	Finding	Status
Author identity	Articles are attributed to SinShield Editorial, but there is no author profile, named editor, qualifications, or reviewer information.	Needs Attention
About and ownership	The homepage contains an About section, but no dedicated About, Team, or editorial standards page explains who operates the product and publication.	Needs Attention
Contact	A support email appears in Organization schema and the client-rendered footer.	Good
Sensitive-topic safeguards	Legal content includes a clear non-legal-advice caveat; research articles carefully separate correlation, causation, and uncertainty.	Good
First-party transparency	The accountability-app comparison states that SinShield is ranked first by its own maker and explains the resulting bias.	Good
Independent trust signals	No visible reviewer credentials, testing methodology, testimonials, press references, certifications, or public changelog were found in audited HTML.	Missing

Content for AI Synthesis

Signal	Finding	Status
Clear core claims	Homepage and articles state their principal answer or product promise near the top.	Good
Factual density	Android page contains concrete facts such as supported apps, protection layers, model checks, and protection levels; research articles include study details and legal distinctions.	Good
Source citations	Five substantial articles link directly to research, official platform policies, laws, or primary provider pages.	Good

Signal	Finding	Status
Comprehensiveness	The strongest articles cover definitions, caveats, steps, and FAQs. Product and hub pages remain too thin for confident synthesis.	Needs Attention
Originality	On-device architecture and privacy claims are specific, but the site lacks original benchmark data, methodology, or independently verifiable testing results.	Needs Attention

Technical GEO

Signal	Finding	Status
AI discovery file	Live llms.txt is invalid because the server falls back to the homepage. Deploying the prepared Markdown file is the immediate fix.	Missing
Crawler access	robots.txt permits crawling and points to the sitemap; no audited page is blocked.	Good
Brand entity consistency	SinShield naming, URL, logo, publisher, and product identity are consistent across metadata and schema.	Good
sameAs graph	No verified external identity links are declared in Organization schema.	Needs Attention
Render accessibility	Core content and schema are available without executing the Vue client, reducing crawler dependence on JavaScript rendering.	Good

AEO Analysis

Score 7 of 10 - On Track

Featured Snippet Eligibility

Signal	Finding	Status
Direct answers	Several articles open with a concise answer and use a visible short-answer note, especially the X, IQ, benefits, and country-law articles.	Good
Question headings	Only three audited H2 headings are phrased as questions. Most sections use descriptive statements instead.	Needs Attention
Lists and tables	Articles use ordered steps, bullet lists, and comparison tables that are suitable for extraction.	Good
Definition patterns	Legal and research articles define key distinctions clearly, including problematic use, IQ, and types of legal restriction.	Good

Structured Answer Formats

Signal	Finding	Status
FAQ schema	Homepage has eight visible FAQs mirrored in valid FAQPage schema.	Good
HowTo schema	Products contains visible installation steps mirrored in valid HowTo schema.	Good
Article FAQs	Some articles answer common questions, but they are not consistently organized into a reusable FAQ block. Do not add FAQ schema unless the answers are visible and maintained.	Needs Attention
Speakable schema	No SpeakableSpecification was detected. This is optional and lower priority than trust and content improvements.	Needs Attention

Voice Search Readiness

Signal	Finding	Status
Conversational wording	The site uses natural questions and plain-language answers suitable for voice and assistant responses.	Good

Signal	Finding	Status
Long-tail coverage	Article topics closely match specific search questions, including X policy, IQ effects, country law, and accountability apps.	Good
Answer brevity	Strong articles provide compact summary answers, while product pages and the blog index offer too little explanatory context.	Needs Attention
Local signals	Not applicable: SinShield is a digital product rather than a location-based service.	Good

Priority Recommendations

Work from top to bottom. The first five items provide the clearest combination of low-to-moderate effort and meaningful search or AI-discovery impact.

Priority	Issue	Dimension	Effort	Impact
Critical	Deploy the prepared Markdown llms.txt so /llms.txt returns text/plain with the H1 and links.	GEO	Low	High
High	Create an About and Editorial Standards page naming the operator, editorial process, source policy, review process, and corrections contact.	GEO	Medium	High
High	Add named author or reviewer profiles and connect Article schema authors to stable profile URLs.	GEO	Medium	High
High	Expand /products, /products/android, and /blog with substantive copy that answers compatibility, setup, limitations, privacy, and category-navigation questions.	SEO / GEO	Medium	High
High	Add contextual internal links from every article to the relevant product page and two or three related articles.	SEO	Low	High
Medium	Change the blog H1 to identify the blog, then render the featured article as an H2; add Blog or CollectionPage plus ItemList schema.	SEO / AEO	Low	Medium
Medium	Shorten long titles and descriptions while preserving the primary query and distinct value proposition.	SEO	Low	Medium
Medium	Add sameAs links for verified Google Play and official social profiles to Organization schema.	GEO	Low	Medium
Medium	Add lastmod values to the sitemap from real content modification dates.	SEO	Low	Medium
Quick Win	Turn selected article subheadings into natural questions and place 40-60 word direct answers immediately below them.	AEO	Low	Medium
Quick Win	Add one or two credible sources or an explicit experience basis to the scroll-trigger article.	GEO	Low	Medium
Medium	Add HSTS and a tested Content-Security-Policy at the live origin after confirming application compatibility.	Trust	Medium	Medium

Implementation Guidance

Trust and editorial identity

Create a permanent About page and a separate Editorial Standards page. Name the product operator and the people responsible for sensitive-topic content. Describe how sources are selected, when medical or legal review is used, how conflicts are disclosed, and how readers can request corrections. Give each recurring author or reviewer a stable profile URL and reference that URL from Article schema.

Product and hub content

The product hub should explain platform availability, Android requirements, installation, permissions, supported apps, limitations, false-positive handling, website filtering, VPN compatibility, privacy, pricing, and support. The Android detail page should answer these topics in enough depth to stand independently. The blog index should introduce the publication, expose topic groupings, and use an H1 such as SinShield Blog or Digital Habits and Recovery Guides.

Internal linking

Add contextual links inside each article rather than relying only on navigation. Link product-relevant claims to the Android page, connect related articles in both directions, and use descriptive anchor text. A practical target is one product link plus two or three related-article links per post, provided each link genuinely helps the reader.

Snippet editing

Preserve unique intent while shortening titles that are likely to truncate. Keep the query-bearing phrase early and move the brand suffix out when needed. Tighten long descriptions to roughly 140-160 characters. Use natural question headings only where users actually ask the question, followed by a complete 40-60 word answer before additional detail.

Crawler files and sitemap

Keep robots.txt as currently deployed: allow all crawlers and reference the sitemap. Deploy the prepared llms.txt to the web root and verify HTTP 200, Content-Type text/plain, an H1, and Markdown links. Add accurate lastmod dates to sitemap entries only when page content materially changes.

What Is Working Well

Strength	Evidence
Crawlable architecture	All canonical pages return meaningful prerendered HTML rather than an empty JavaScript shell.
Metadata consistency	Every audited page has a unique title, description, canonical URL, Open Graph metadata, and Twitter card.
Structured data	Organization, WebSite, FAQPage, HowTo, SoftwareApplication, Article, and BreadcrumbList types are valid and aligned with visible content.
Research quality	The major articles cite studies, legislation, and official platform policies while communicating limitations carefully.
Product clarity	The Android page states supported apps, privacy behavior, protection layers, and account requirements with concrete facts.
Accessible imagery	No missing alt attributes were found among the seven prerendered content images.

Observed crawler endpoints

[robots.txt](#) - Valid plain-text file with sitemap reference.

[sitemap.xml](#) - Valid XML index containing all ten audited canonical pages.

[llms.txt](#) - Currently returns homepage HTML and requires deployment of the prepared Markdown file.

Glossary

SEO

Search engine optimization improves how search engines crawl, understand, index, and rank pages. It includes technical accessibility, metadata, content quality, internal links, and structured data.

GEO

Generative engine optimization makes content easier for AI answer systems to understand, trust, synthesize, and cite. It emphasizes clear claims, factual support, entity identity, source quality, and author credibility.

AEO

Answer engine optimization structures content so search features, voice assistants, and AI tools can extract a direct and accurate response. It favors concise answers, question-led sections, lists, tables, FAQs, and matching schema where appropriate.

E E A T

Experience, expertise, authoritativeness, and trustworthiness are quality signals used to assess whether content and its publisher deserve confidence, especially for subjects that can affect health, safety, finances, or legal decisions.

Structured data

Structured data is machine-readable markup, commonly JSON-LD using Schema.org vocabulary, that declares entities and relationships such as organizations, software applications, articles, FAQs, and breadcrumbs.
